HeatGate: Teammate Tasks (website screens)

Oct 8, 2026 · @Satya

You build the screens people see in the demo, using the Claude chat app. The builder sets up the website skeleton and the data connection first, so you only fill the pages and make them look great on a projector. Prompts W2, W3, W5, W6 and W7 are in the Team Prompt Book. This doc says when to use them, and adds five prompts for the demo feel.

How you work

You edit	You never edit
`web/src/pages/` and `web/src/components/`	`web/src/api.ts`, `web/src/hooks/`, `web/src/theme.ts`, `web/fixtures/`, `contracts/`, `policies/`, or any other folder

1. **One time:** clone the repo, run `git checkout web`, then `npm install`. Wait for the builder's message "skeleton is up", then run `git pull`.
2. **One page per chat.** Attach `contracts/types.ts` and the page's current file. Start the chat with the line below, then paste the prompt.
3. **Copy the files into place**, run `npm run dev --workspace web`, and open `http://localhost:5173`.
4. **Screenshot loop.** Paste a screenshot of the page into the chat with prompt P1 below, apply the fixes, and repeat until it looks right from across a room.
5. **When something breaks,** paste the full error text into the chat. Never describe it in your own words.
6. **Commit only your folders:** `git add web/src/pages web/src/components`, then `git commit -m "<message>"` and `git push`.

The line that starts every prompt. It replaces the shorter line in the Team Prompt Book, because the builder's skeleton already has the data hooks and the design tokens:

```
Give me complete files, one at a time, each with its path under
web/src/pages/
or web/src/components/. Do not give partial snippets. Use the existing hooks
in
web/src/hooks/ and the design tokens in web/src/theme.ts. Do not call fetch
or
api.ts directly, and do not edit anything outside web/src/pages and
web/src/components. If you need a new hook or a new design token, tell me its
name and what it should return, and I will ask the builder.
```

Every number on screen comes from the API through the hooks. Never calculate a metric inside a page.

Your tasks, day by day

The builder runs W1 (the skeleton) and the `api.ts` parts of W4 and W7. You start at W2. When a Team Prompt Book prompt says "using api.ts only" or "add renderPolicy to api.ts", the line you start every chat with already covers it. Delete the words about adding functions to `api.ts` from W7 before you paste it.

Day 1: today, Thursday

Time	Task	Prompt	Done when
17:30	Clone the repo, switch to `web`, run `npm install`. While you wait, sketch the map screen on paper using the six scenes below	none	The repo is on your laptop
About 18:30	The builder says "skeleton is up". Run `git pull` and open the site	none	Three pages show, with a "Demo data" banner
18:30 to 19:15	Policy Sandbox page	W2	The controls, the animated map and the comparison table work on fake data

Time	Task	Prompt	Done when
19:15 to 19:45	Rider View and Audit Log pages	W3	Clicking a dot opens the rider card, and the audit table filters and opens a detail panel
19:45	Show-and-tell. Push `web`, and give the builder your first feedback list	Feedback format below	The builder has merged `web` into `main`
19:45 to 22:00	Polish every page. Then loading, empty and error states. Then scenario buttons, only once the base pages work	P1, P5, P2	Each page reads well from 3 metres away
About 22:15	The builder merges to `main`. Run `git pull`, then `git merge main`	none	The pages show real data

Day 2: Friday

Time	Task	Prompt	Done when
Morning	Cedar source panel and the heat sweep chart	W6	The panel shows the selected rule set's rules, and the chart draws four lines
About 13:00	Push `web`, tell the builder, then `git pull` and `git merge main`	none	The money columns show real numbers
Afternoon	Languages, once the translated labels arrive	W5	The rider card switches between English, Hindi and Telugu, and Urdu if available
Afternoon	Presenter mode	P3	Pressing P goes full screen, and keys 1 to 6 jump between scenes
About 19:00	Test the live site on your phone and on a second laptop. Send the builder a feedback list	P1	Every page works on a phone and on a projector-sized screen

Day 3: Saturday

Time	Task	Prompt	Done when
09:00 to 10:30	Polish pass on every page. Get the six scenes working in presenter mode	P1, P3	Each scene looks right on a projector
About 10:30	The builder announces new types and functions. Run `git pull`, then `git merge main`, then build the new screens	W7 (screens only)	The sliders re-render the Cedar text, a replay day runs, and the platform view shows its five numbers
13:00	Push `web`. This is the last merge	none	The builder has deployed
14:00	Feature freeze: fixes only	P1	No new features after this

Time	Task	Prompt	Done when
14:00 to 17:30	Rehearse the demo three times with the builder, once with the network off. Record the video	Demo script in the plan doc	Two takes recorded

What the demo needs from the screens

The demo is three minutes and six scenes. Design each page for the scene it carries, not for the page list.

Scene	On screen	What the room should feel	Comes from
1	One click on "Real day: Hyderabad"	This is real, not a toy	P2
2	The map: dots move and turn amber when riders get a break	The rules act, live	W2
3	Click a dot: a phone card in Hindi or Telugu	A real rider gets this message	W3, W5
4	The "why" panel shows the exact Cedar rule that fired	Every decision can be explained	W6
5	The four-column comparison with ranges	Safety and pay side by side	W2
6	A judge moves a slider and the numbers change	They can test the rule themselves	W7

Projector rules. Light theme. Text at least 18 px, key numbers 28 px or bigger. One accent colour for HeatGate Fair. Keep amber, blue and red for rider states only. Never put a rupee amount on screen without the word "placeholder" nearby.

Five extra prompts

Use these in the same chat as the page they change, after its first working version. Start each with the line from "How you work".

P1. Screenshot review (after every page)

Paste a screenshot of the page with this prompt, then paste the updated file Claude gives you.

```
Here is a screenshot of my page on a laptop. The room will see it on a
projector
from 3 to 6 metres. List the 5 biggest problems for readability and impact,
most important first, each with the exact change (which element, which size
or
colour). Then give me the complete updated file. Do not change any data logic
or numbers.
```

P2. Scenario buttons

```
Add three scenario buttons at the top of the Policy Sandbox page: "Normal
day"
(peak 34 C, alert level 0), "Heatwave day" (peak 44 C, alert level auto) and
"Real day: Hyderabad" (disabled unless the weather-day hook returns a
Hyderabad
day; until then show it greyed out). Each runs the simulation through the
existing hook with those values and shows the result with a short fade. Move
the sliders under an "Advanced" toggle, so nobody has to touch them on stage.
```

P3. Presenter mode

```
Add a presenter mode, toggled by pressing P: full screen, base text 22px, and
all banners hidden except the "All rupee amounts are placeholders" note. Keys
1
to 6 jump to six scenes, which are sections of the existing pages: 1 the
scenario buttons, 2 the map playing, 3 the rider card, 4 the "why" panel
showing the Cedar rule, 5 the comparison table, 6 the rules sliders (hidden
until they exist). Add a small on-screen hint: "P presenter, 1-6 scenes". Do
not add any new data logic.
```

P4. Heat tint (optional, only if everything else is done)

```
Add a subtle background tint on the Policy Sandbox page that moves from cool
to
warm as the heat index of the current frame rises from 30 to 46. Use at most
two colours, keep text contrast at least 4.5 to 1, and keep the map dot
colours
unchanged.
```

P5. Loading, empty and error states

```
Add loading, empty and error states to every page: a skeleton while loading,
a
clear message with a retry button when the server is down or returns an
error,
and an empty state when there are no results. Do not change how data is
fetched.
```

Hand-offs with the builder

The builder gives you	When
"Skeleton is up": the pages, the hooks and the design tokens, pushed to `web`	About 18:30 today
Merged code in `main` with real data: `git pull`, then `git merge main`	About 22:15 today, 13:00 and 19:00 on Day 2, 10:30 on Day 3
A new hook or design token, if you asked for one	Within the hour

You give the builder	When
A pushed `web` branch and a message "web pushed"	At every sync point
A numbered feedback list from using the real site	After every sync point
The English label list from `web/src/i18n.ts`, for the translators	Day 2 morning

Feedback format. The builder pastes your list straight into Claude Code, so give each item one page, what you saw, and what you expected:

```
1. Policy Sandbox: the heatgate-fair column is hard to tell apart from the
others
   from 2 metres. Expected: a clearly different colour.
2. Rider View: the rest countdown is smaller than the heading. Expected: the
   countdown is the biggest thing on the card.
3. Audit Log: filtering by rider does nothing when I pick R-014. Expected:
only
   R-014's rows. Screenshot attached.
```

If there is no third person. The Team Prompt Book has a section for Teammate 3 (evidence, translations, interviews, README, QA). If nobody takes it, split it like this:

Task	Who	Prompt
Check the NDMA advisory numbers	Builder	T1
What platforms say about heat	Builder	T5
Find native speakers and send them the message sheet; clean the filled sheet	You	T2, T3
Rider interviews and the settings table	You, Day 2 evening	T4
README draft	Builder	T6
QA on the live site	You, Day 3	T7
